

Project Introduction

Zimou Gao

Leader of EV Charging Robot Team

Program Manager of Florabot

Research Assistant of Field Robotics Lab

Product Manager of TP-LINK

Consultant of MiracleTech

Graduate Student of Robotics in NEU

6 Years Working Experience in Engineering R&D and Program Management

2018 - Present

- Created a robot system for Robotic EV charging (**Leader**)
- Developed robotics for floral industry (**Program Manager**)
- Infrared Image SLAM & Drone Application (**Research Assistant**)
- Wearable Device for Parkinson Patients (**Developer**)
- Expanded US market for MiracleTech Co. (**Consultant**)

2015 - 2018

- Built & characterized Security Monitoring product, the pioneering work for TP-LINK Smart Home System to scale from 1 - N (**Product Manager**)
- Teaching-by-Hand Spaying Robot (**Developer**)

TP-LINK Product Line Development (Product Manager)

Assistive Writing Device for Parkinson's Patient

Ngatpriet Singh Nir, Mingda Ju, Xuyang Sun, Zimou Gao

Wearable Device for Parkinson Patients

Eliminate the tremors of Parkinson's patients and stabilize their hands for writing task

ABSTRACT

Parkinson patients face a lot of difficulties in their daily lives. Due to some problems in their brains, they can't control their bodies properly.

Therefore, we decided to design a kind of wearable device that assists them to write. The device's function is to eliminate the tremors of Parkinson's patients and stabilize their hands for writing task, hoping to alleviate some problems in their lives.

BACKGROUND

Motivations

- Parkinson Disease affects approximately seven million people globally and one million people in the United States [1]. The number of new cases per year of PD is between 8 and 18 per 100,000 person [2]. Therefore, such high incidence rates will inevitably cause a large burden to the patient's families and to the society as a whole.
- Although there are current devices that exist in the market and reported by media to help Parkinson's patients, their high price has discouraged many patients from buying them. So, we aim to build a wearable device using open source platforms and simple components, so that the device can be made available to a more number of patients.

Problem Analysis

- We imitated writing activities of the Parkinson patients and normal people and place the EMG sensor on different area of arms to detect muscular activities data, which is showed below.
- The Parkinson patients do want to control the involuntary torque produced by the forearm muscles, but this kind of behavior sets up a positive feedback loop which will continuously amplify the hand tremors of patients, intensifying the hand movements, making it very difficult for the patient to write.

METHODS

Methodology

We cancel the involuntary torque produced by the patients' forearm, we can help them to write.

Dynamic Modeling

We used Newton Euler approach to develop the dynamic model of the one link pendulum to simulate the patients' tremors.

Simulation and experimental validation

We built a prototype to test the validity of our controller and understand the limitations of our simulation. Figure below shows the block diagram of major components of our prototype:

Emma Project's Picture

<https://www.microsoft.com/en-us/research/project/project-emma/>

RESULTS

Prototype Construction

We built a prototype which is shown above. The pendulum is pinned to the 3D printed base linkage. The base linkage is mounted to the wooden base using 4 screws. In the front, we have Arduino Uno which is our single board computer where control algorithms are run. The motor driver is mounted on the 400 pin breadboard. At the back, we have 9v battery to power the Arduino and 2 x 3V battery to power up the motor.

Introduce the prototype

Parts Included In The Prototype

| Item | Mass (gram) | Inertia (kg-m ² × 10 ⁻⁴) |
|-------------------------|-------------|---|
| Arduino | 27.22 | 4.6 |
| Breadboard | 86.18 | 36.22 |
| MPU-6050 | 18.14 | 3.56 |
| Motor | 10.54 | 14.24 |
| Battery (9v) and holder | 63 | 2.1 |
| Button cell and holder | 5.27 | 0.64 |
| Total | 241.6 | 68.50 |

Simulation Result

A Simulation of one link pendulum that can be balanced by tuning the gains of the PD controller as well as a LQG controller.

CONCLUSIONS

- We have defined a design process for designing a Parkinson's assistive device which is based out of strong mathematical framework supported by simulation and experimental validation.
- An extension to the 3D case requires more rigorous simulations, experimental testing and data collection with the actual PD patients.
- The device cancels out the tremors of the patient to make motion of hand stable.
- The device is light weight. It should not interfere with normal function of the limb.
- The device is easy to wear and easy to switch on/off.
- The device is operated on battery power, it needs to be energy-efficient.

The image features a minimalist design with abstract geometric line art in the corners. In the top right, a complex network of thin grey lines connects several black dots, forming a web-like structure. In the bottom left, there are several smaller, more isolated geometric shapes, including triangles and line segments, also composed of thin grey lines and black dots. The central text 'Thank you' is rendered in a large, bold, black sans-serif font, positioned in the middle of the frame against a plain light grey background.

Thank you
